

# LBNE Photon Detector System

## Performance Studies at TallBo

Stuart Mufson  
Denver Whittington

Indiana University

February 14, 2014

- Acrylic bar spray-coated with wavelength shifting compound
  - Inspired by design from MIT
  - 6 mm x 1 in x 20 in
    - 1 m long in FD, 4 per paddle
  - Wavelength shifter (WLS) melted into surface
    - Tetraphenyl butadiene (TPB) or
    - 1,4-bis-(o-methyl-styryl)-benzene (bis-MSB)
  - Comparing 10, 20, 35, & 50 coats

- 3 Silicon Photomultipliers (SiPM) read out end of bar
  - Strongly reverse-biased array of photodiodes
  - SensL MicroFB-60035-SMT
  - 6 mm x 6 mm active area (18960 microcells)
  - 24.5 V bias (gain of a few  $\times 10^6$ )
  - Signal into shaper/amplifier (gain  $\sim 200$ )

- 4 PD paddle prototypes
  - 4 bars per paddle
    - 14 flash-heated (IU)
    - 2 hand-painted (MIT)
- Hodoscope array and scint. paddles
  - 4-fold coincidence for cosmic ray selection and track reconstruction
- Goals
  - Exercise readout of multiple paddles
  - Study relative light yields from various waveshifter/coating combinations
  - Study scintillation detection from cosmics with a large variety of tracks through LAr volume
- Two operating modes
  - Cosmic hodoscope trigger
  - Free run (self-triggered)

- Installation on October 11, LAr on October 16/17
- Successful operation until October 31

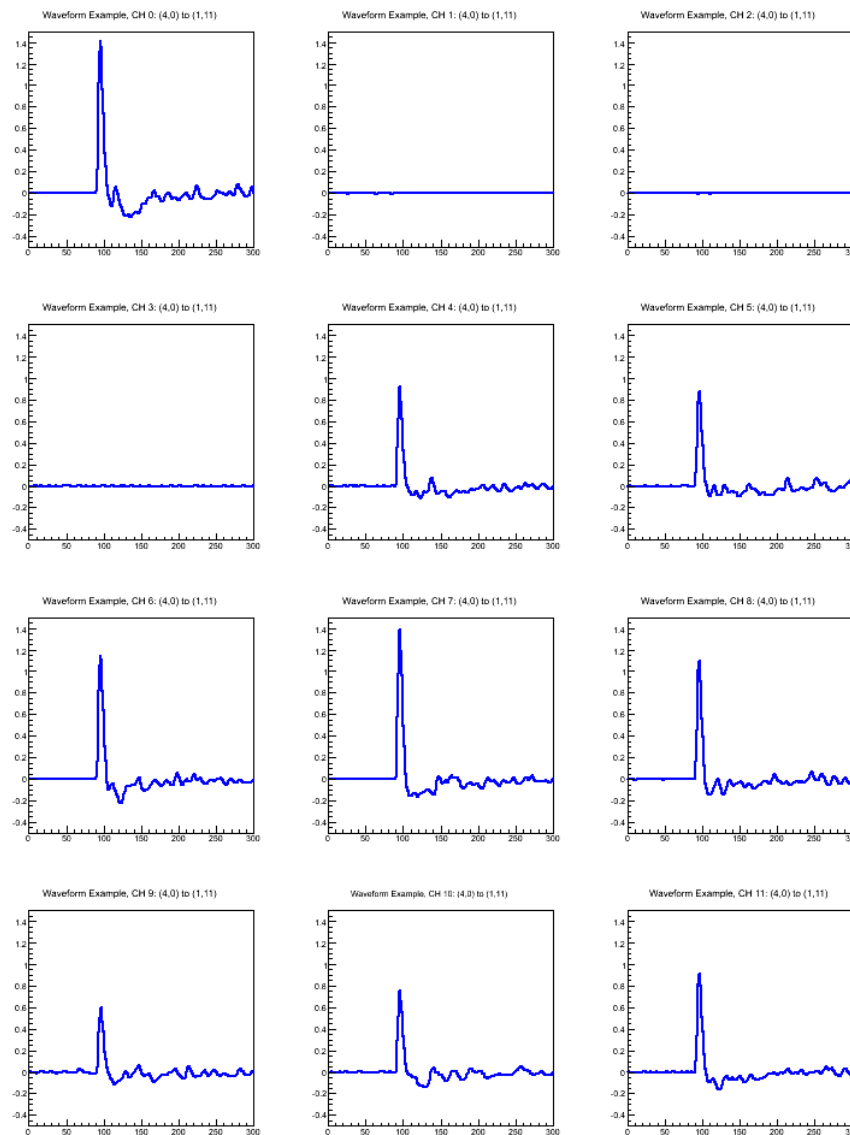

- Variety of track trajectories through hodoscope to study

## Side View

Y-Z coordinate of Hodoscope Hit, with all track trajectories

## Example Track viewed by Paddle B

TPB-20

TPB-20

## Top View

X-Z position of intersection with dewar, with all track trajectories

Bis-MSB 35

Bis-MSB 35

- Hodoscope track selection great, but makes cross-paddle comparisons difficult

- Similar coverage within each paddle
  - On-diagonal paddles best exposed
- Uneven coverage of different paddles

- “Free run” mode to collect light from all cosmics through dewar
  - Eventually collect light from all points in LAr volume
  - Even and comparable exposure of all bars

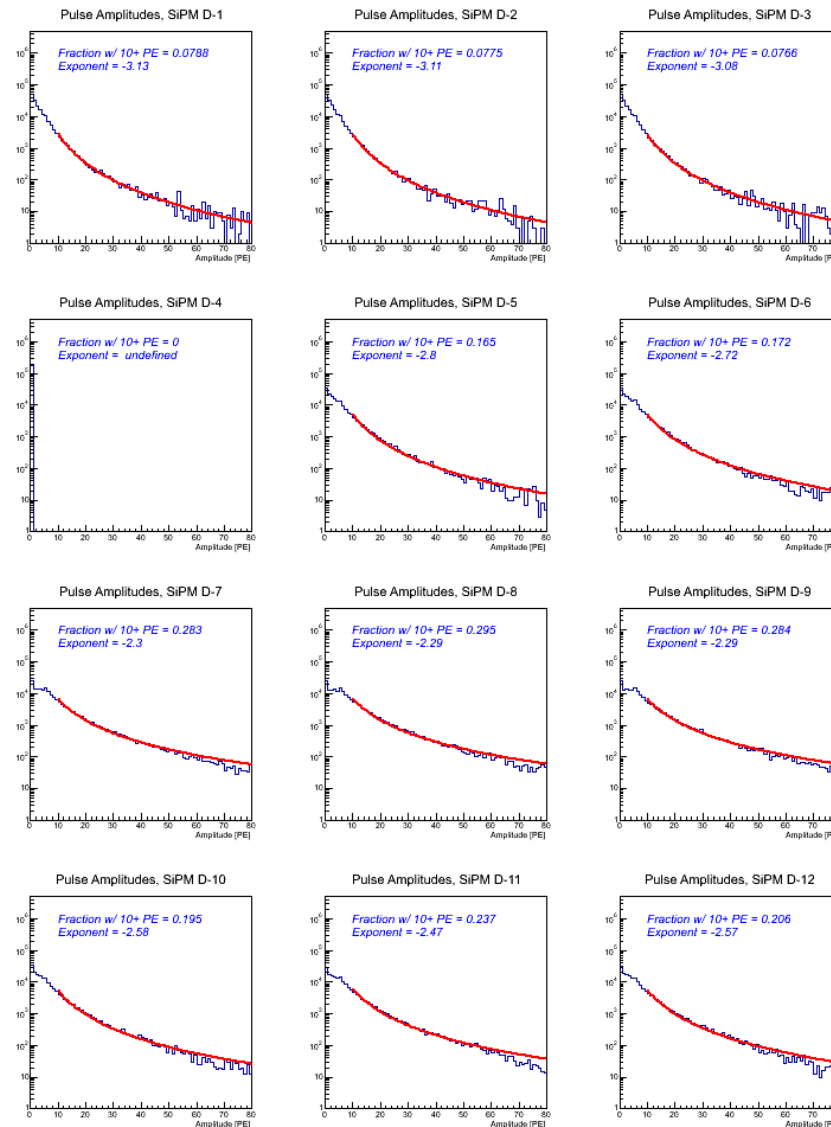

- “Free run” mode (self-triggered, OR of all SiPMs in a paddle)
  - Light from all cosmics through dewar
  - Look at distribution of calibrated signal amplitudes on each SiPM

- Each bar experiences approximately the same light exposure
  - Studied with toy MC

- Look for relative differences in light yield distributions

- Total number of photons collected per hour
- Shape of power-law fit to distribution
  - Longer tail indicates better efficiency

Bis-MSB 10

Bis-MSB 20

Bis-MSB 35

Bis-MSB 50

- Total number of photons collected per hour by each bar
  - Averaged over functional SiPMs

Photons Collected per hour (from 10+ PE triggers)

- 35 coats best option for both TPB & bis-MSB
- Hand-painted bars most efficient (but not a scalable method)

## ➤ Paddle C

Average Light Collected per SiPM vs Transverse Track Position, Bar C-1

Average Light Collected per SiPM vs Transverse Track Position, Bar C-2

Average Light Collected per SiPM vs Transverse Track Position, Bar C-3

Average Light Collected per SiPM vs Transverse Track Position, Bar C-4

## ➤ Average signal versus perp distance to bar

Average Signal, Bar C-1

Average Signal, Bar C-2

Average Signal, Bar C-3

Average Signal, Bar C-4

- Free run mode provides good handle on bar-to-bar performance comparisons
  - Two useful figures of merit
    - Total photons collected per hour
    - Shape of signal amplitude (PE) distribution
  - Consistent with intra-bar comparisons from hodoscope tracks
- Best flash-heated bars
  - TPB 20-35 coats
  - Bis-MSB 35 coats
- Hand-painted TPB bars overall best
  - Flash-heating may be damaging too much waveshifter
    - May also worsen surface quality (more losses at internal reflections)
  - “Artisan” bars not scalable manufacturing method
  - Assembling roll-coater to produce consistent bars
  - Testing cast acrylic doped with 1% TPB
- Mechanical malfunction led to loss of signal from 7 SiPMs
  - Have revised SiPM mount design

- LBNE Photon Detector prototype tests continue
  - TallBo experience was very valuable
    - much experience & insight gained
    - several revisions underway
- Analyses continuing
  - Bar-to-bar comparisons
  - Light yield vs track position
  - Effects of Xe-doped LAr
  - Properties of late light signal

- Ready for round two!
  - Investigating alternatives to flash heating
  - Looking forward to testing new ideas

- Big thanks to everyone who helped make this possible!

# Backup

Waveform Example, CH 6: (4,0) to (1,11)

- Leading pulse from prompt scintillation ( $\tau \sim 6$  ns)
- Post-pulse activity from secondary scintillation ( $\tau \sim 1.6$   $\mu$ s)
- Pulse heights fall into discrete values, corresponding to integer photoelectron signals

Pulse Amplitude: SiPM B-9 (Bis-MSB 35)

Pulse Amplitude: SiPM B-9 (Bis-MSB 35)

## ➤ Paddle A

Pulse Amplitudes (Averaged over SiPMs), Bar A-1

Pulse Amplitudes (Averaged over SiPMs), Bar A-2

Pulse Amplitudes (Averaged over SiPMs), Bar A-3

Pulse Amplitudes (Averaged over SiPMs), Bar A-4

## ➤ Paddle B

Pulse Amplitudes (Averaged over SiPMs), Bar B-1

Pulse Amplitudes (Averaged over SiPMs), Bar B-2

Pulse Amplitudes (Averaged over SiPMs), Bar B-3

Pulse Amplitudes (Averaged over SiPMs), Bar B-4

## ➤ Paddle C

Pulse Amplitudes (Averaged over SiPMs), Bar C-1

Pulse Amplitudes (Averaged over SiPMs), Bar C-2

Pulse Amplitudes (Averaged over SiPMs), Bar C-3

Pulse Amplitudes (Averaged over SiPMs), Bar C-4

## ➤ Paddle D

Pulse Amplitudes (Averaged over SiPMs), Bar D-1

Pulse Amplitudes (Averaged over SiPMs), Bar D-2

Pulse Amplitudes (Averaged over SiPMs), Bar D-3

Pulse Amplitudes (Averaged over SiPMs), Bar D-4

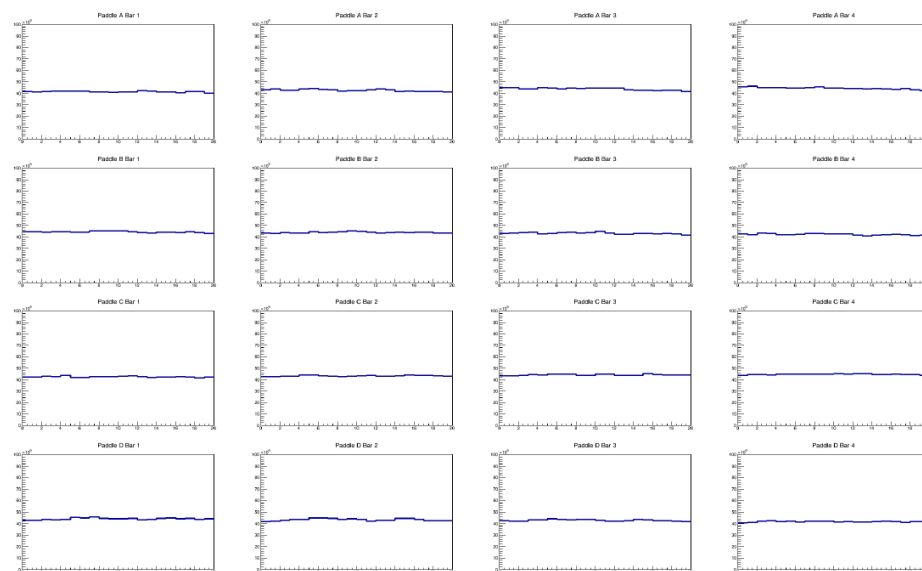

- Simulate light from cosmics through LAr volume
  - Johnathon Lowery (IU)
  - Throw cosmic ray, throw photons along track, see how much hits each bar along length

- Scintillation exposure versus position along bar
  - All bars receive approximately the same number of photons along length
  - Minimal variation between bars in different paddles
  - Confident this is a good metric

- Exponent
  - (smaller is better!)

- Both figures of merit well correlated

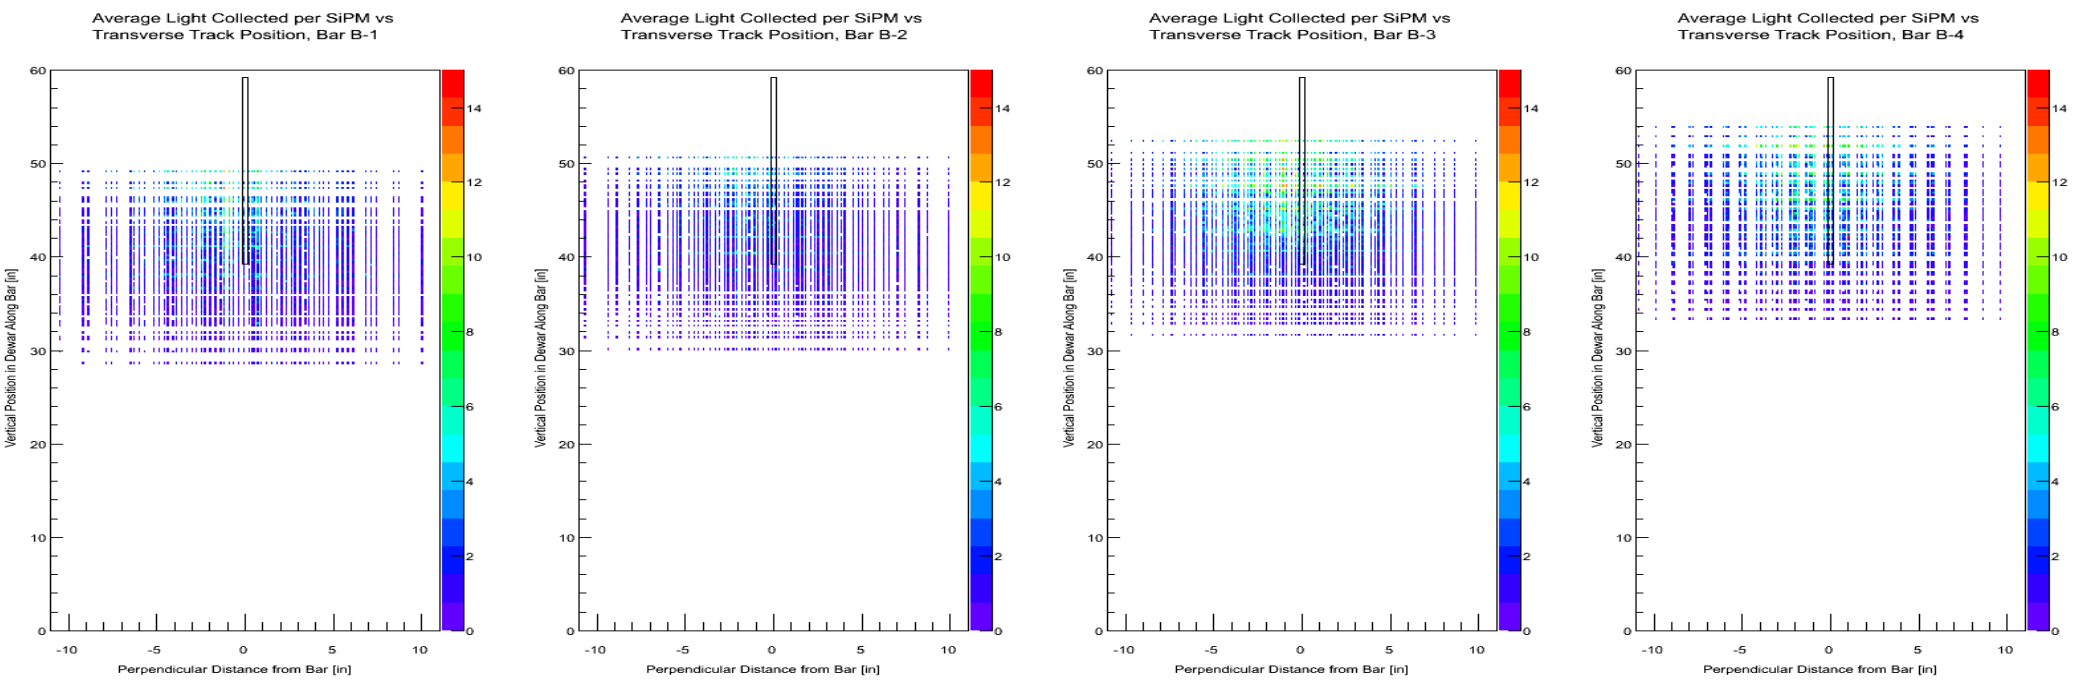

- Two 8x8 Arrays of PMTs from CREST balloon-based cosmic ray experiment
  - Barium-fluoride crystals with TPB coating
  - Positioned on opposite sides of dewar (one elevated 48")
- Plastic scintillator paddles
  - Gamma (Compton, etc.) veto
    - $\text{BaF}_2$  crystals sensitive to x-rays
- Shower vs single particle discrimination
- Approximate track reconstruction
- Four-fold coincidence trigger
  - >1 PMT on each array
  - One paddle on each side
  - ~2 Hz 4-fold trigger rate

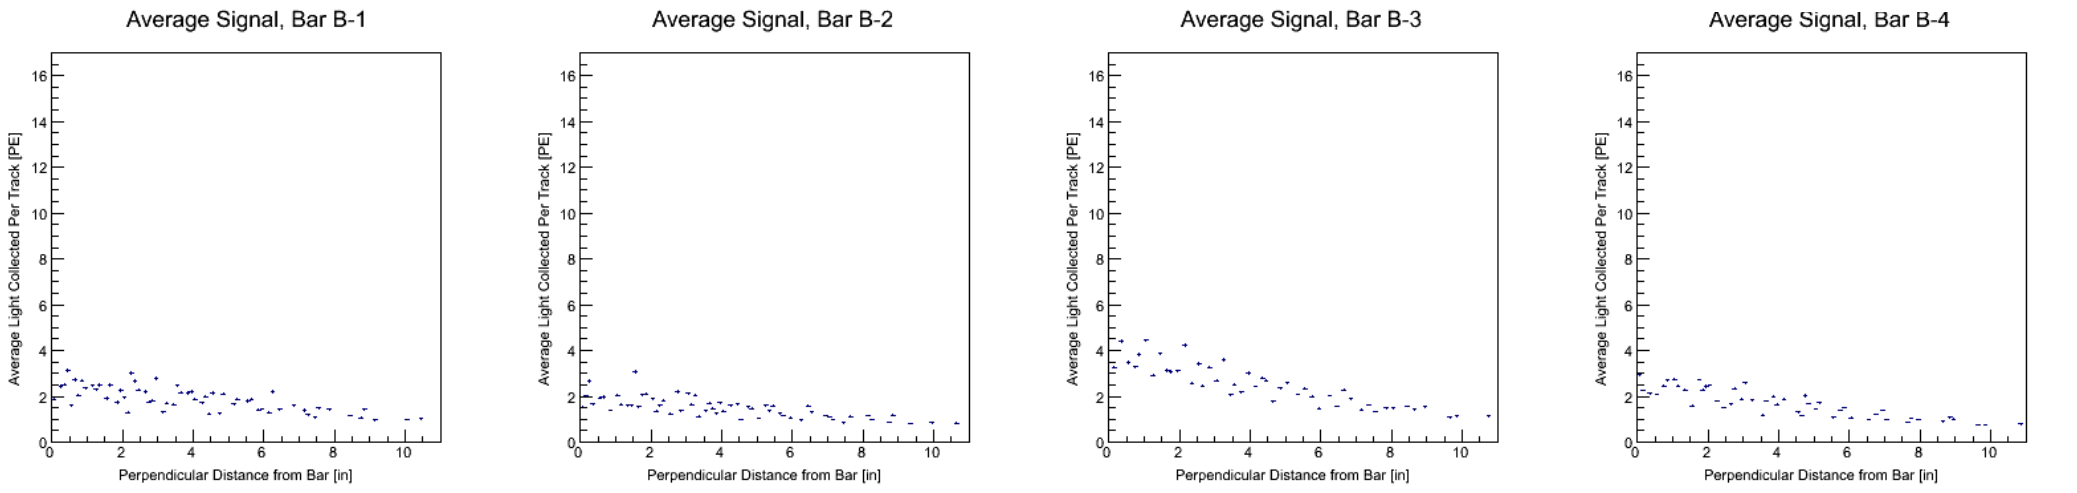

➤ **Paddle B** (Tracks far from readout = weaker average signal)

➤ **Average signal versus perp. distance to bar**

- Returning to PAB starting February 24th
- New technologies
  - New custom readout electronics from G. Drake et. al. (ANL)
  - New cables (twisted pair)
    - previous found to be prone to noise pickup
  - Test of new LED-based calibration system (Z. Djurcic)
- Larger diversity of bar designs
  - Flash-heated TPB (35 coats) and Bis-MSB (35 coats) (IU)
  - Cast with TPB (IU)
  - Cast with TPB (LBNL)
  - Dip-coated TPB (MIT)
  - Fiber mounts (CSU)
  - Roll-coat painted (IU)
- Will rely on free-run mode for primary bar-to-bar performance comparisons, with hodoscope as cross-check.

➤ Set of 3 independent SiPMs

- SensL MicroFB-60035-SMT
- 24.5 V bias

➤ Nevis shaper/amplifier

- Differential shaping
- Gain  $\sim 200\times$

➤ CAEN DT5740

- 32 input channels
- 62.5 MHz sample rate
  - (16 ns / sample)
- 0.48 mV / ADC Count
  - (12-bit, 2 V pp input range)

## Yields vs Track Proximity, Paddle A

Average Light Collected per SiPM vs Transverse Track Position, Bar A-1

Average Light Collected per SiPM vs Transverse Track Position, Bar A-2

Average Light Collected per SiPM vs Transverse Track Position, Bar A-3

Average Light Collected per SiPM vs Transverse Track Position, Bar A-4

## Yields vs Track Proximity, Paddle B

Average Light Collected per SiPM vs Transverse Track Position, Bar B-1

Average Light Collected per SiPM vs Transverse Track Position, Bar B-2

Average Light Collected per SiPM vs Transverse Track Position, Bar B-3

Average Light Collected per SiPM vs Transverse Track Position, Bar B-4

## Yields vs Track Proximity, Paddle C

Average Light Collected per SiPM vs Transverse Track Position, Bar C-1

Average Light Collected per SiPM vs Transverse Track Position, Bar C-2

Average Light Collected per SiPM vs Transverse Track Position, Bar C-3

Average Light Collected per SiPM vs Transverse Track Position, Bar C-4

## Yields vs Track Proximity, Paddle D

Average Light Collected per SiPM vs Transverse Track Position, Bar D-1

Average Light Collected per SiPM vs Transverse Track Position, Bar D-2

Average Light Collected per SiPM vs Transverse Track Position, Bar D-3

Average Light Collected per SiPM vs Transverse Track Position, Bar D-4

## ➤ Attenuation Length Measurement in LAr

- Select tracks within 3 inches of bar surface

## ➤ Paddle B

Signal from Tracks within 3 inches of Surface, Bar B-1

Signal from Tracks within 3 inches of Surface, Bar B-2

Signal from Tracks within 3 inches of Surface, Bar B-3

Signal from Tracks within 3 inches of Surface, Bar B-4

## ➤ Paddle C

Signal from Tracks within 3 inches of Surface, Bar C-1

Signal from Tracks within 3 inches of Surface, Bar C-2

Signal from Tracks within 3 inches of Surface, Bar C-3

Signal from Tracks within 3 inches of Surface, Bar C-4

- Possible increase of losses at surface (internal reflection)
- Simulated light bouncing down length of acrylic bar in LAr
- Very minor effect going from air to liquid argon
- Can mimic change in attenuation length by increasing surface loss %
